(Received 21 November 2016; revised manuscript received 13 January 2017; published 7 February 2017)

Bell's theorem states that some predictions of quantum mechanics cannot be reproduced by a local-realist theory. That conflict is expressed by Bell's inequality, which is usually derived under the assumption that there are no statistical correlations between the choices of measurement settings and anything else that can causally affect the measurement outcomes. In previous experiments, this "freedom of choice" was addressed by ensuring that selection of measurement settings via conventional "quantum random number generators" was spacelike separated from the entangled particle creation. This, however, left open the possibility that an unknown cause affected both the setting choices and measurement outcomes as recently as mere microseconds before each experimental trial. Here we report on a new experimental test of Bell's inequality that, for the first time, uses distant astronomical sources as "cosmic setting generators." In our tests with polarization-entangled photons, measurement settings were chosen using real-time observations of Milky Way stars while simultaneously ensuring locality. Assuming fair sampling for all detected photons, and that each stellar photon's color was set at emission, we observe statistically significant $\gtrsim 7.31\sigma$ and $\gtrsim 11.93\sigma$ violations of Bell's inequality with estimated p values of $\lesssim 1.8 \times 10^{-13}$ and $\lesssim 4.0 \times 10^{-33}$, respectively, thereby pushing back by ~600 years the most recent time by which any local-realist influences could have engineered the observed Bell violation.

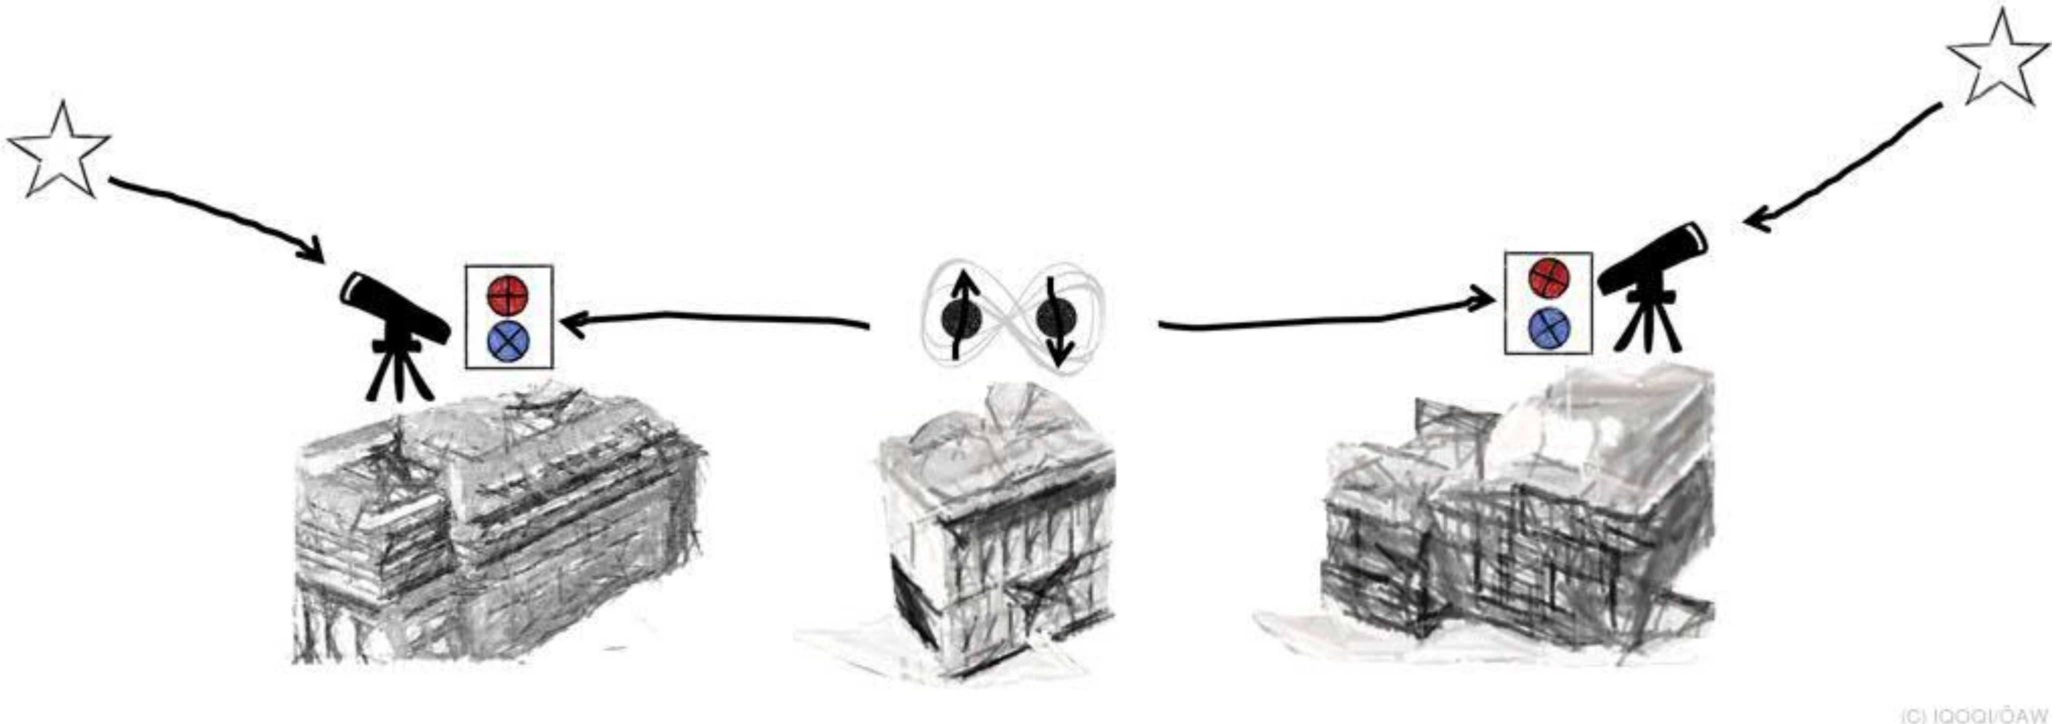
COSMIC BELL TEST SCHEMATIC

Alice: Austrian National Bank

Entangled Particles: Institute for Quantum Optics and Quantum Information

Bob: University of Natural Resources and Life Sciences



OUTLINE

1. Entanglement Tests

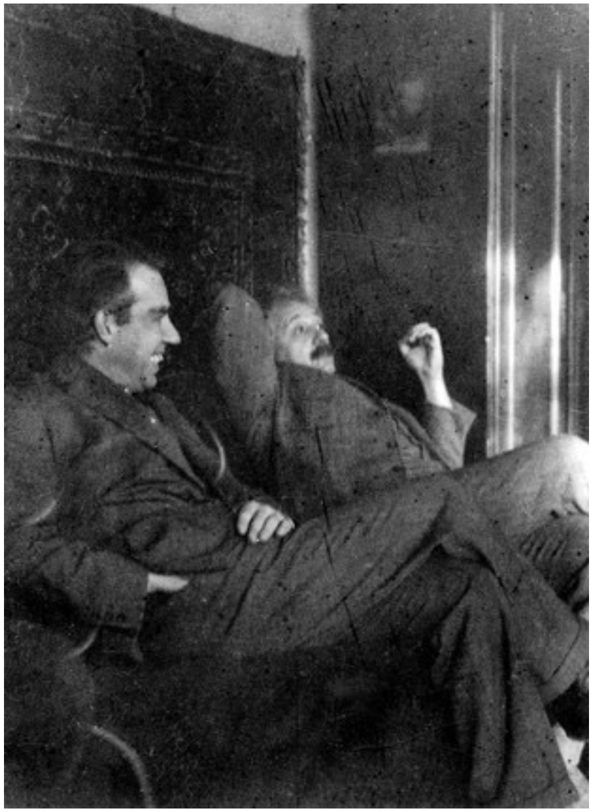
2. Bell's Inequality vs. Bell's Theorem

3. Bell's Theorem Loopholes

4. Cosmic Bell Test with Milky Way Stars

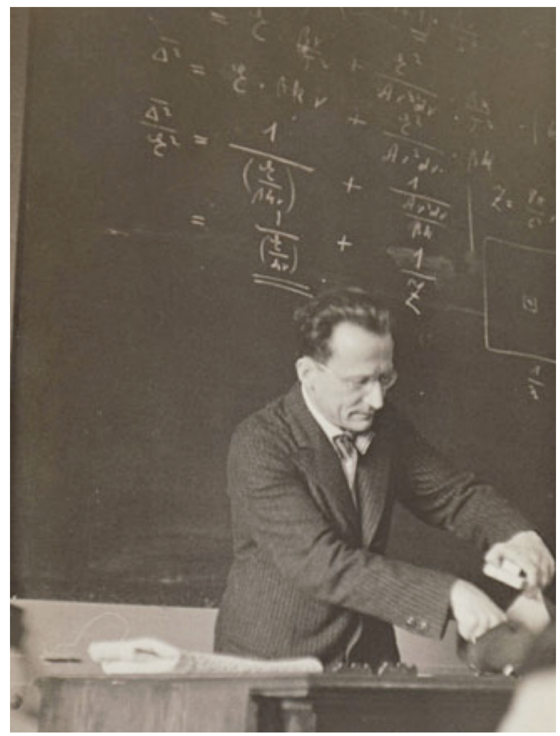
5. Future Cosmic Bell Tests with Quasars, CMB

QUANTUM ENTANGLEMENT



Niels Bohr and Albert Einstein

Beginning in the 1930s, the great architects of quantum theory struggled to understand the notion of "entanglement."

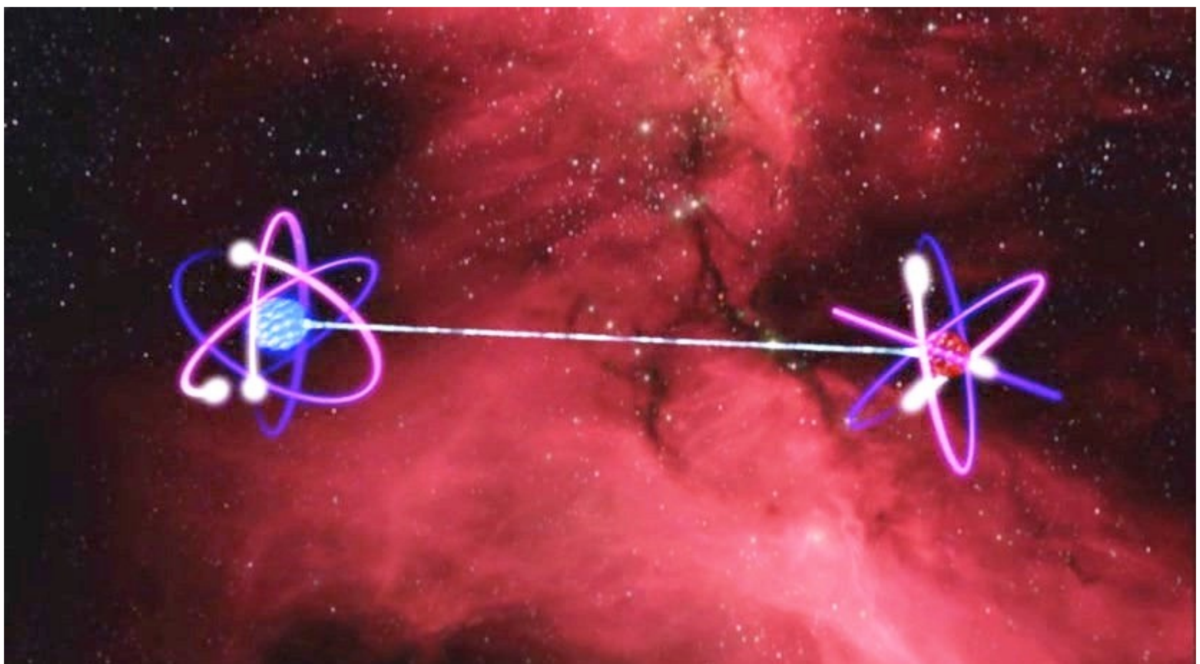


Erwin Schrödinger

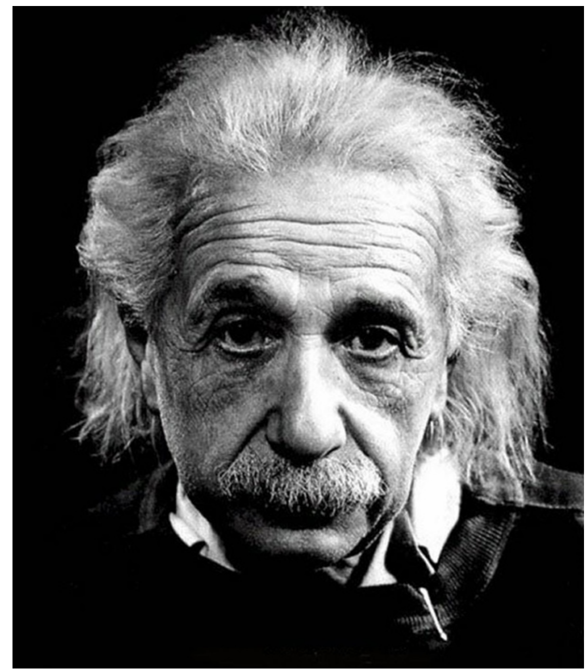
QUANTUM ENTANGLEMENT 101

Entanglement: Paired systems with correlated (or anti-correlated) properties

Measure #1, instantly know something about #2



https://kuleuvenblogt.files.wordpress.com/2014/06/entangled-atoms.jpg



http://xeon24.com/data/wallpapers/2/508769-albert-einstein.jpg

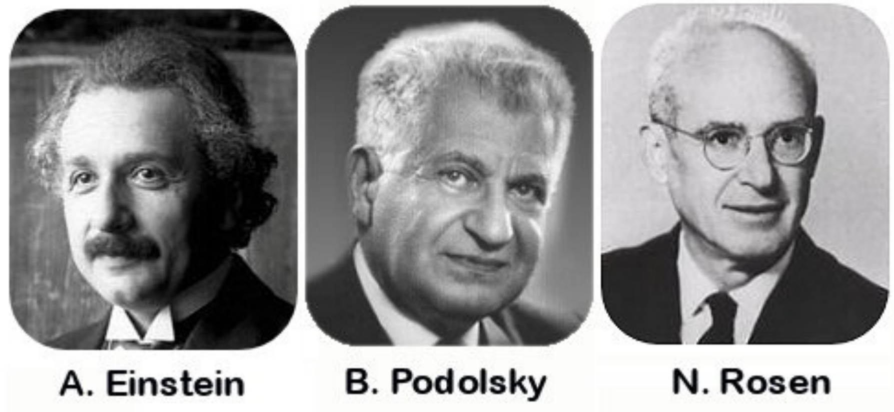
Is quantum mechanics complete or just spooky?

WHY CAUSAL EXPLANATIONS FAIL

Quantum correlation is NOT like classical correlation!

http://themassinvasion.com/wp-content/uploads/2015/07/Mystery-Box.jpg http://youwantmetowearwhat.com/wp-content/uploads/2010/11/Left-Right-Gloves.jpg

EPR PARADOX



E P R

MAY 15, 1935 PHYSICAL REVIEW VOLUME 47

Can Quantum-Mechanical Description of Physical Reality Be Considered Complete?

A. EINSTEIN, B. PODOLSKY AND N. ROSEN, *Institute for Advanced Study, Princeton, New Jersey*

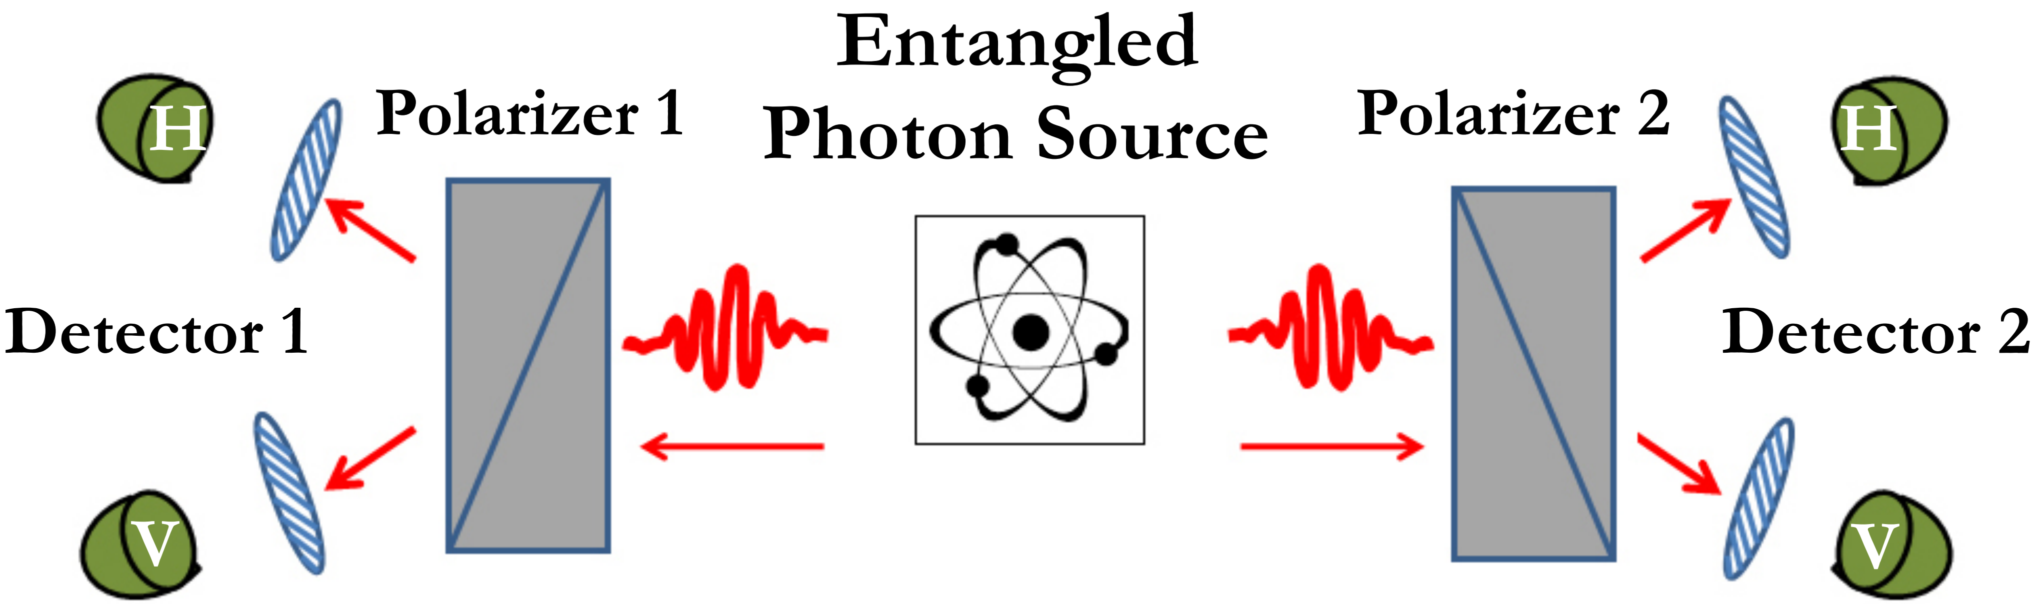
(Received March 25, 1935)

$$|\psi\rangle = \frac{1}{\sqrt{2}}\Big\{|u_1\rangle|v_2\rangle + |u_2\rangle|v_1\rangle\Big\}$$

State does not factorize: no way to describe behavior of particle 1 (u) without referring to behavior of particle 2 (v).

ENTANGLED PARTICLE EXPERIMENTS

"Bell Test"



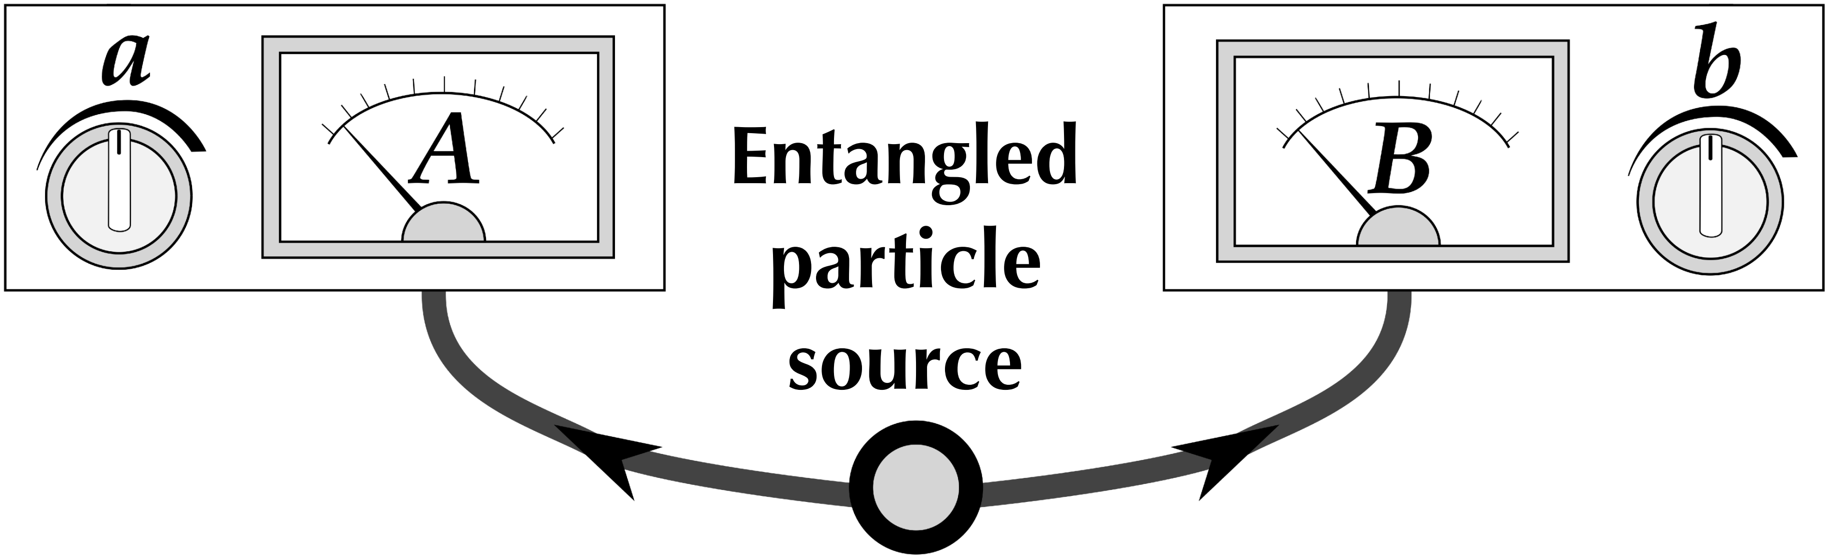
Can rotate polarizers

Same direction: same outcome (HH, VV)

90 degrees: opposite outcome (HV, VH)

Image modified from http://blogs-images.forbes.com/chadorzel/files/2015/07/aspect3.png

BELL TEST



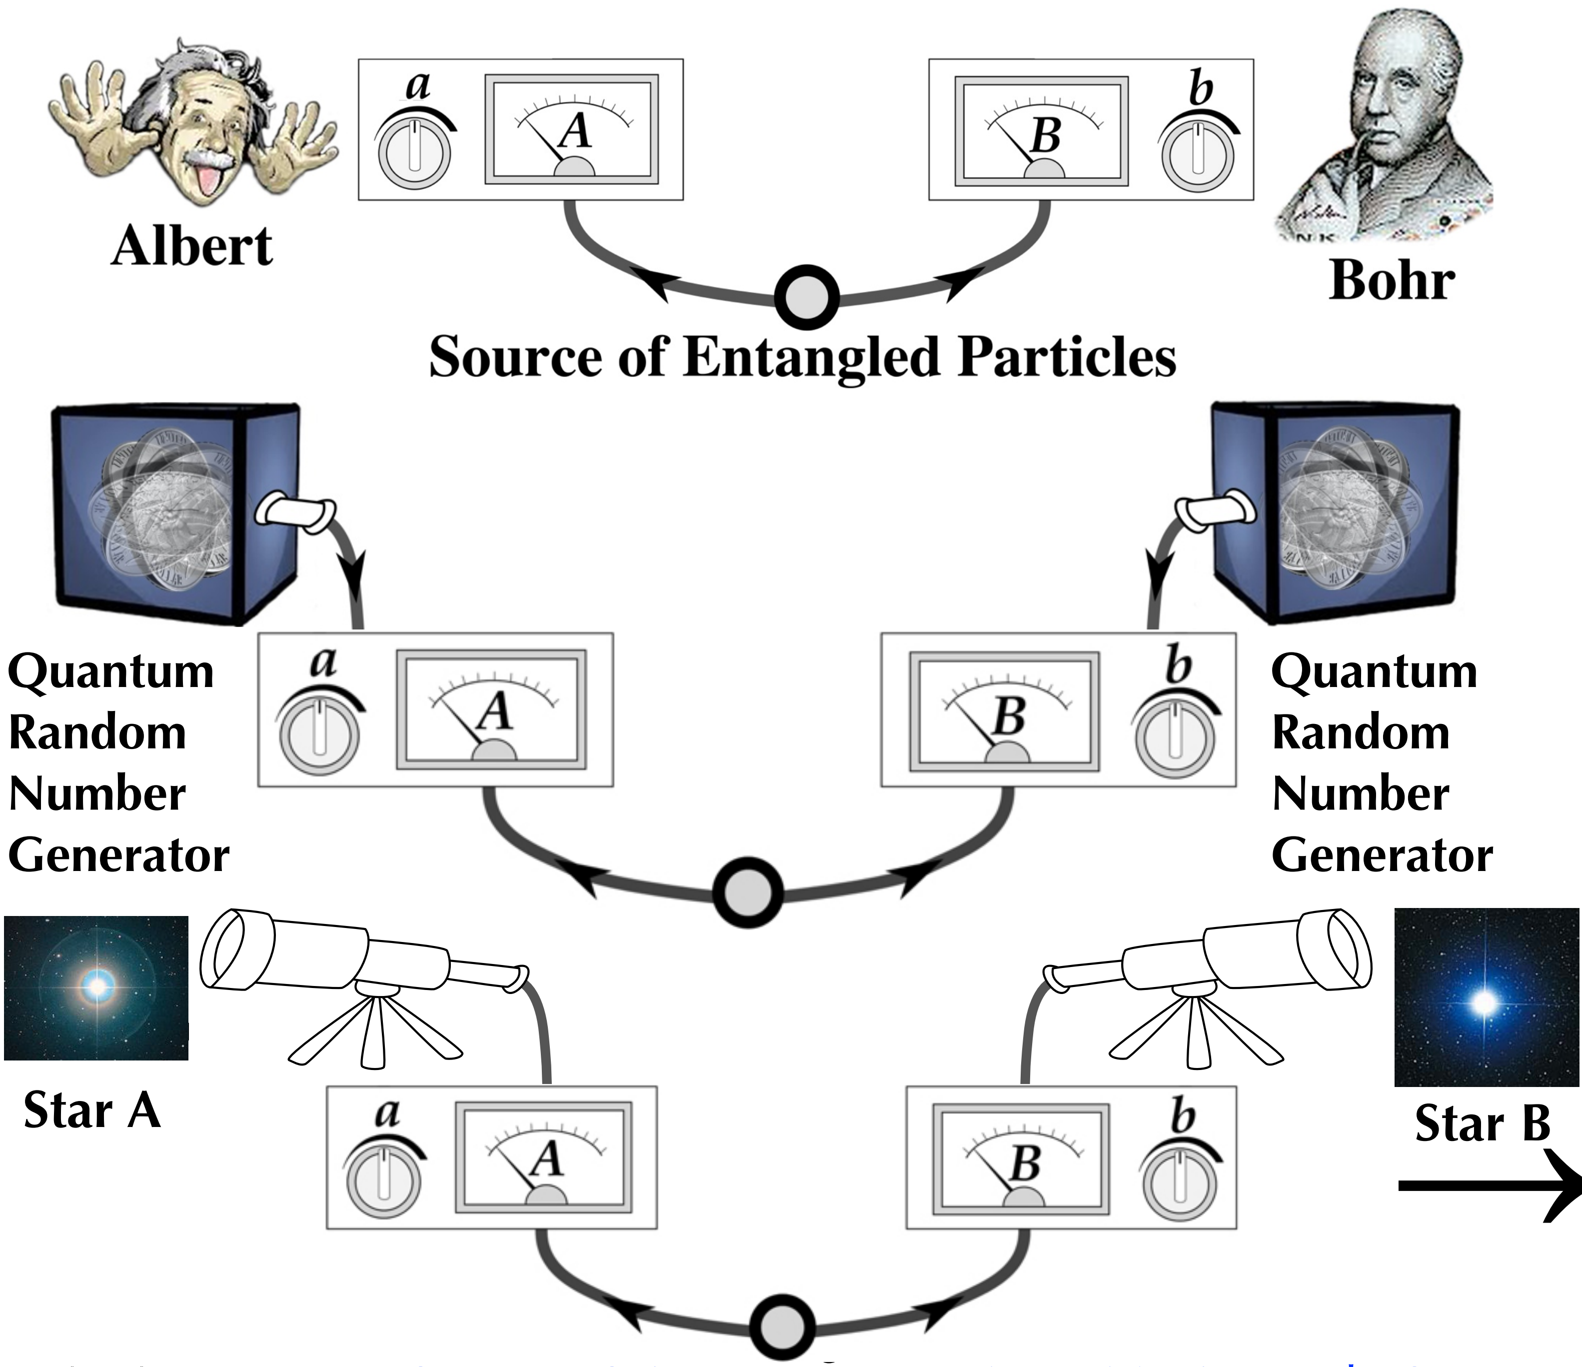
a, *b* : *Settings*

A, *B* : *Outcomes*

Big question: ***Are non-quantum explanations for entanglement viable?***

If yes, QM incomplete → Hidden variables

CHOOSING DETECTOR SETTINGS

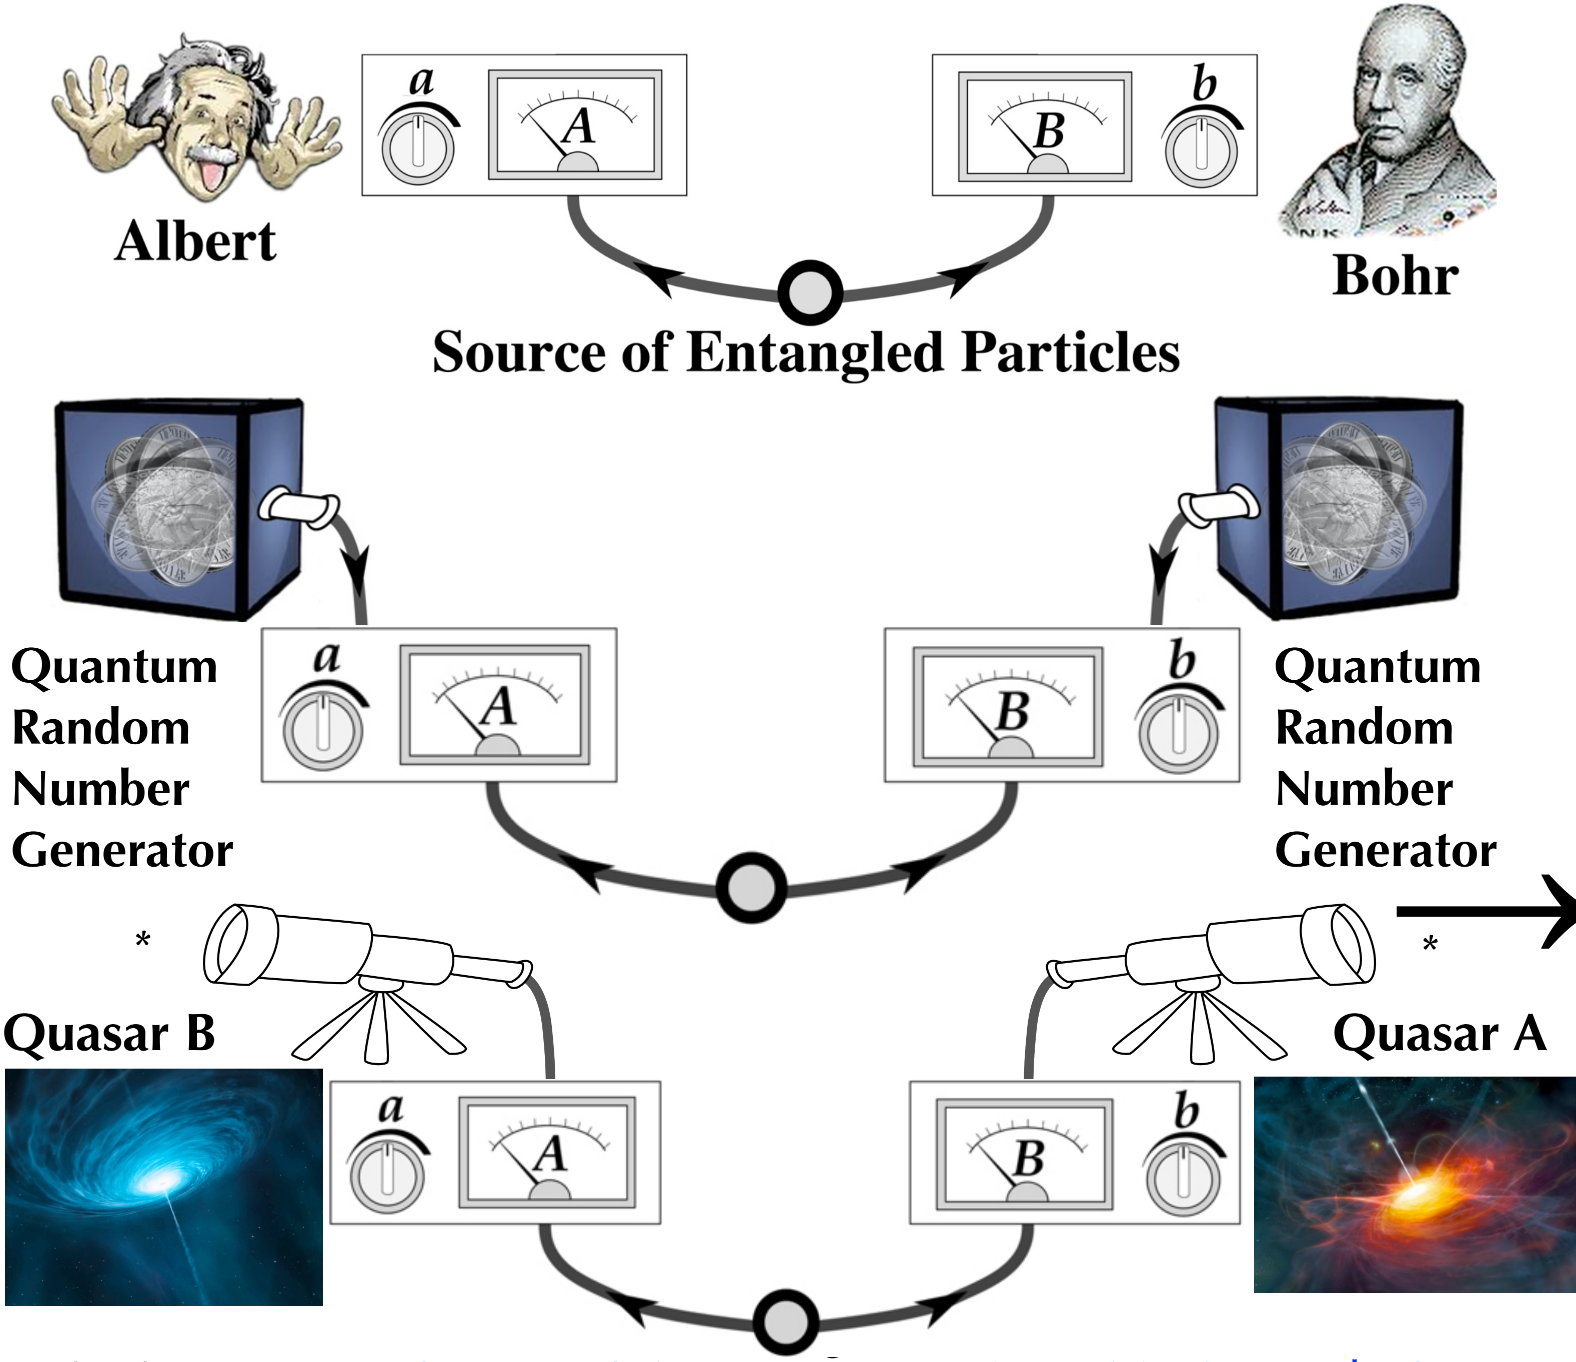


Choose settings with real-time observations of distant Milky Way stars

Requires alternative theories to act hundreds or thousands of years ago

Adapted from: Gallicchio, Friedman, & Kaiser 2014

CHOOSING DETECTOR SETTINGS

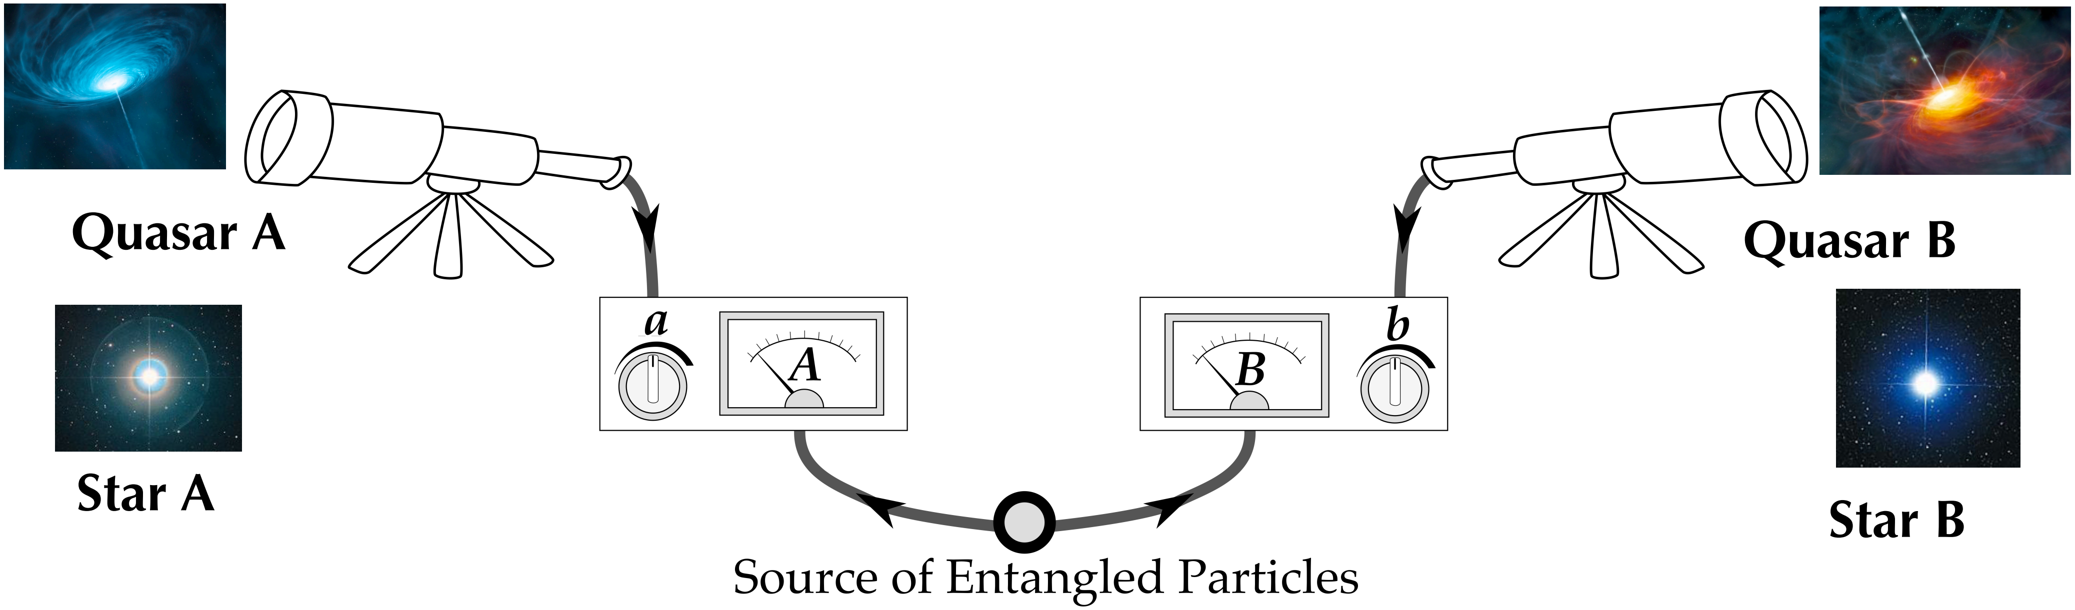


Choose settings with observations of causally disconnected cosmic sources

Relegates alternatives to billions of years ago!

Adapted from: Gallicchio, Friedman, & Kaiser 2014

COSMIC BELL TEST



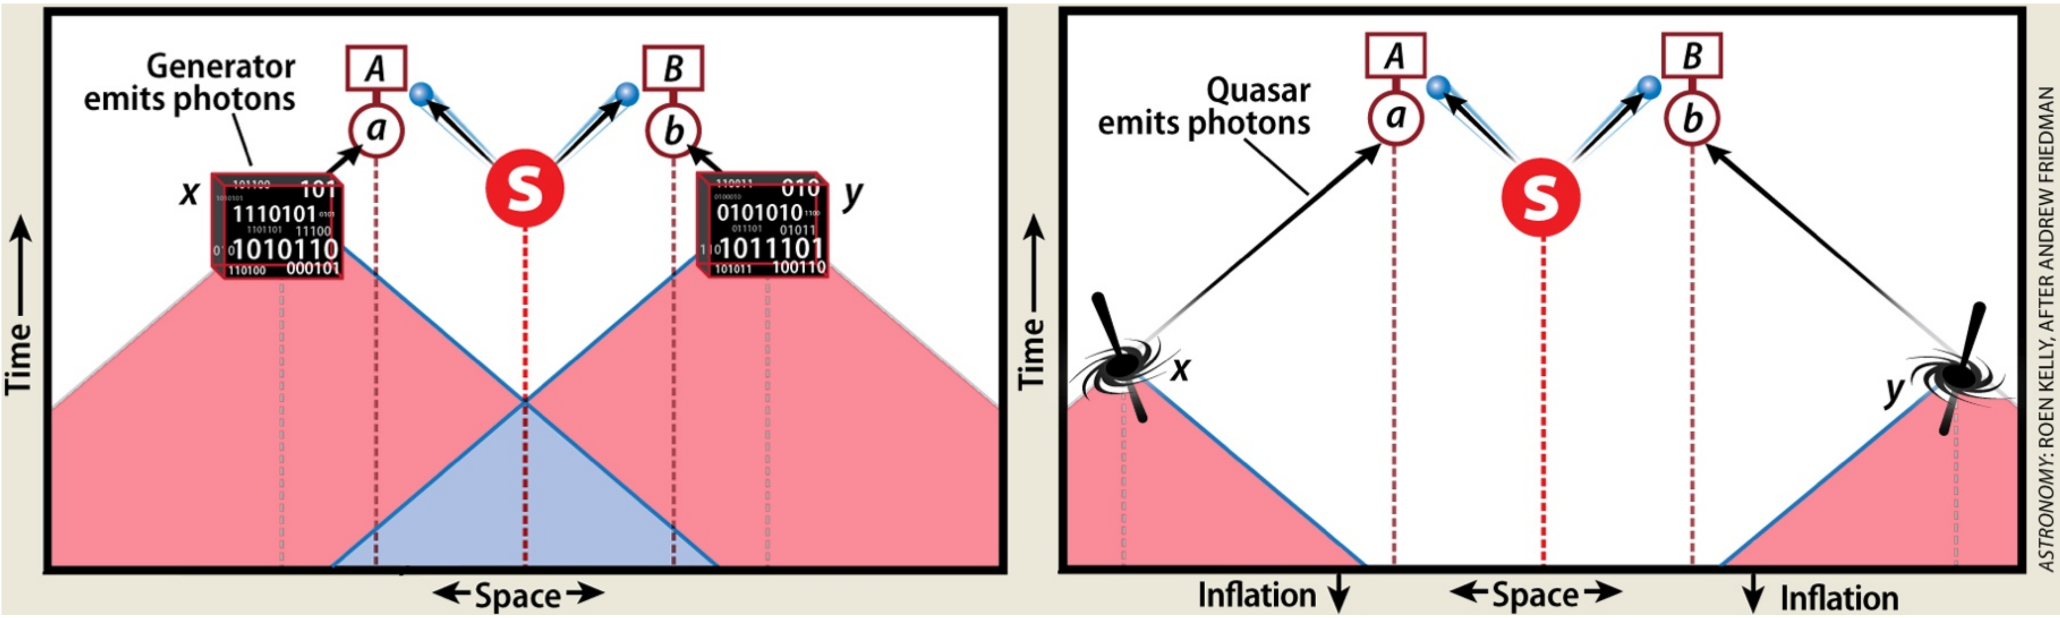
Let the Universe decide how to set up experiment!

Use stars or quasars as cosmic random number generators

Gallicchio, Friedman, & Kaiser 2014, *Phys. Rev. Lett., Vol. 112, Issue 11, id. 110405,* (arXiv:1310.3288)

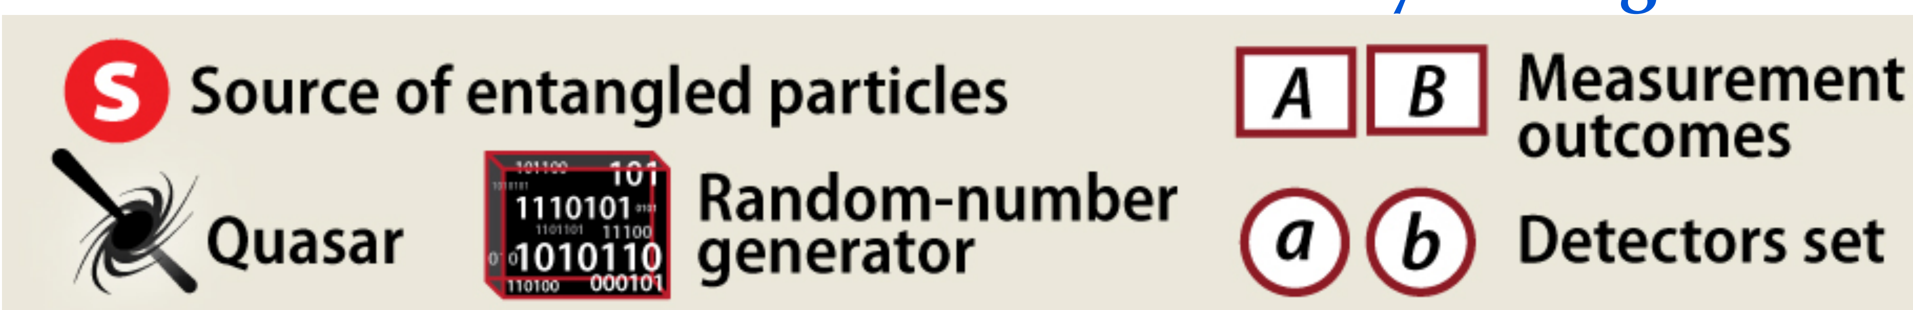
SPACE-TIME DIAGRAMS

Standard Bell Test | Cosmic Bell Test



Past light cones from random number generators overlap milliseconds before test.

Past light cones from quasars don't overlap since big bang, 13.8 billion years ago.



Adapted from: Friedman, Kaiser, & Gallicchio 2013a, *Phys. Rev. D,* Vol. 88, Iss. 4, id. 044038, 18 p. (arXiv:1305.3943)

OUTLINE

1. **Entanglement Tests**

2. **Bell's Inequality vs. Bell's Theorem**

3. **Bell's Theorem Loopholes**

4. **Cosmic Bell Test with Milky Way Stars**

5. **Future Cosmic Bell Tests with Quasars, CMB**

BELL'S THEOREM ASSUMPTIONS

1. Realism
2. Locality
3. Freedom

http://images.iop.org/objects/ccr/cern/54/7/19/CCfac8_07_14.jpg

John S. Bell (1928-1990)

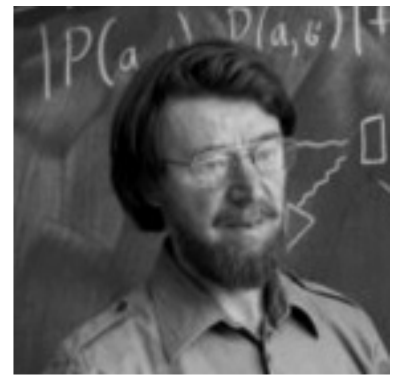
1,2,3 → Bell's Inequality

Limits on "classical" correlated measurements

RELAXING BELL'S ASSUMPTIONS

1. Realism   2. Locality   3. Freedom

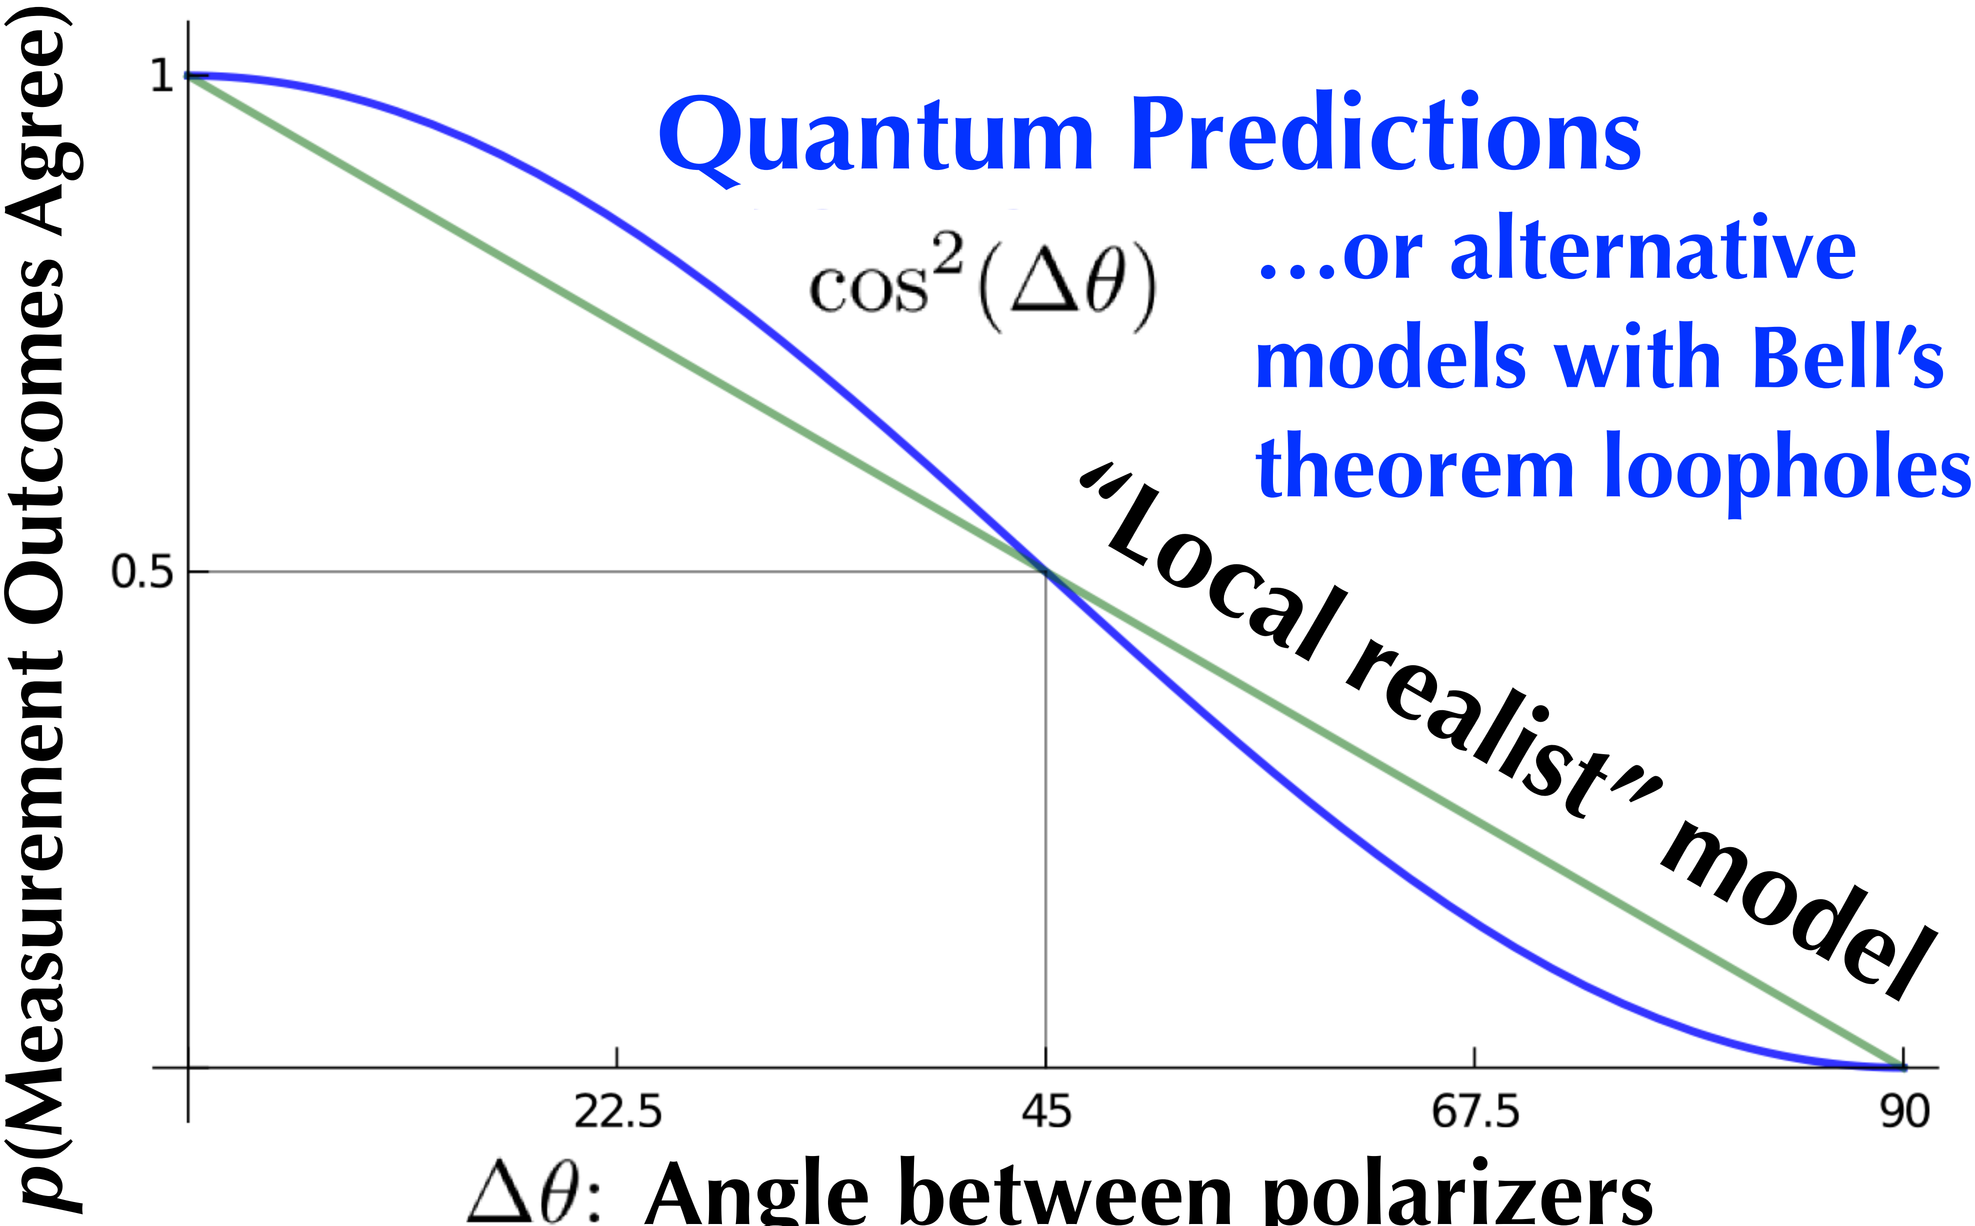
Experiments violate Bell's limit as predicted by quantum mechanics!



→ At least one of 1,2,3 are false!

Relaxing any assumption → LOOPHOLES

PHOTON POLARIZATION CORRELATION



BELL'S THEOREM

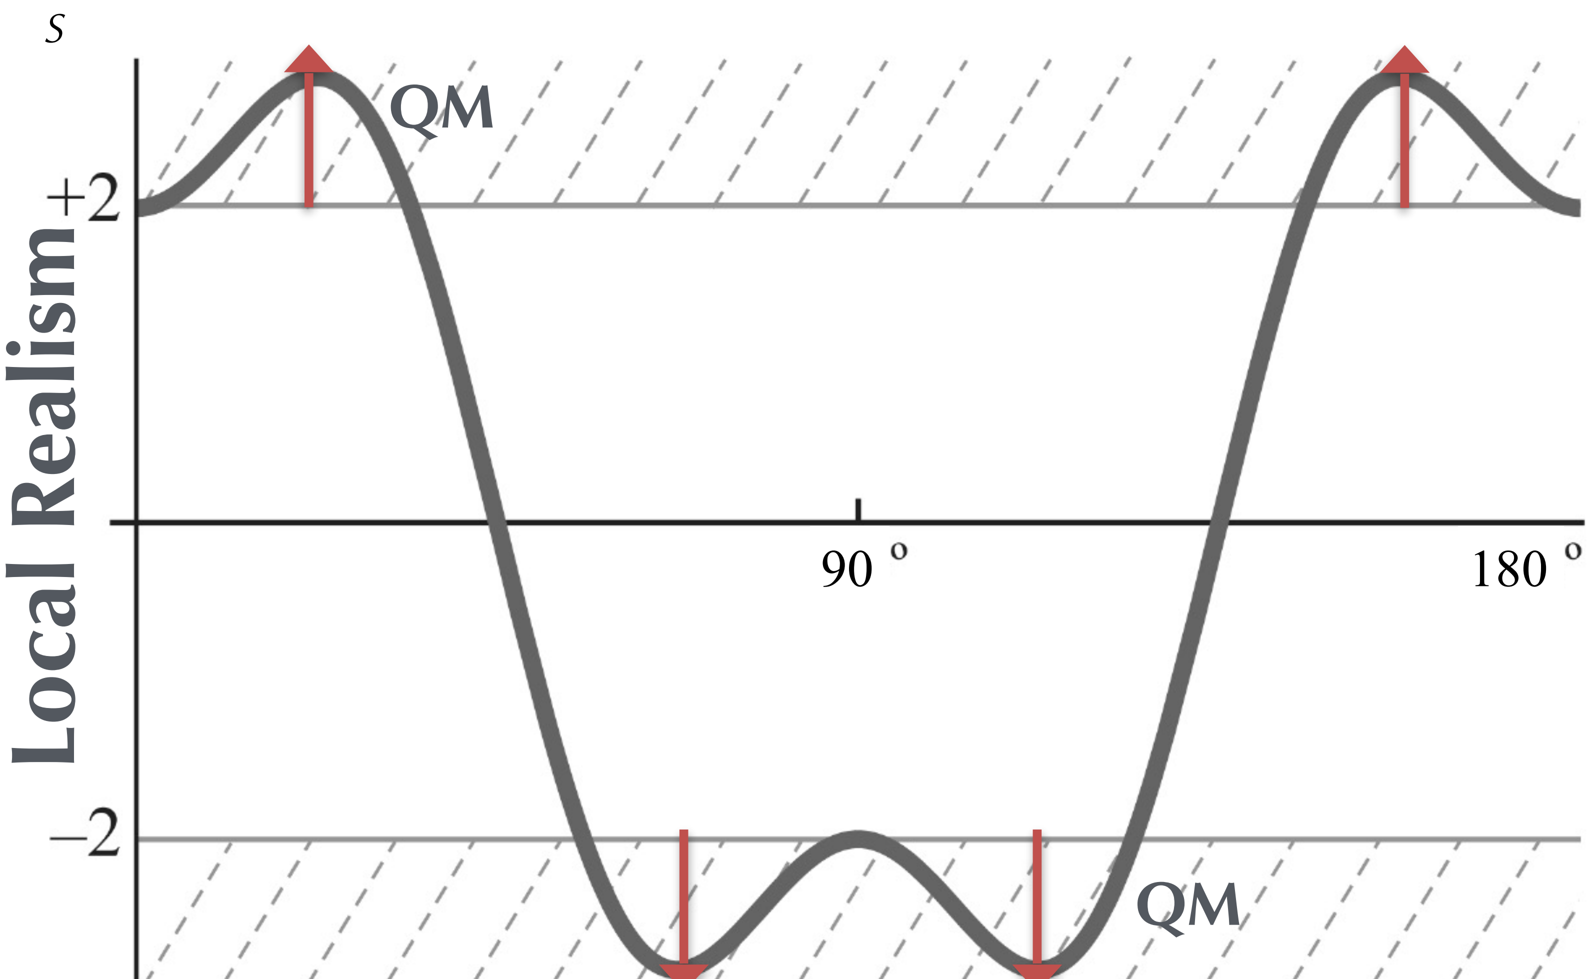
No local-realist theories can reproduce the quantum predictions!

$$S = E(a,b) + E(a',b) + E(a,b') - E(a',b')$$

Bell's assumptions imply $|\, S \,| \leq 2.$

QM prediction: $S_{max} = 2\sqrt{2}$

Dozens of experiments: $S_{max} > 2$



(CHSH) 1969

OUTLINE

1. Entanglement Tests

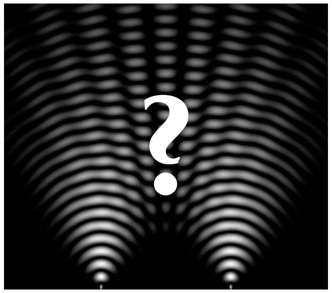
2. Bell's Inequality vs. Bell's Theorem

3. Bell's Theorem Loopholes

4. Cosmic Bell Test with Milky Way Stars

5. Future Cosmic Bell Tests with Quasars, CMB

LOOPHOLES AND WHY THEY MATTER



Quantum foundations!

If universe exploits loopholes, does not mean QM is "wrong", but that perhaps there is a more fundamental underlying theory. Quantum gravity?

Quantum cryptography security

Hackers can exploit loopholes to undermine quantum information schemes

FREE WILL LOOPHOLE

X Shrimp & Chicken Fajita $12.99

Recent Entanglement Tests

Three recent entanglement experiments have closed the "locality" and "detection" loopholes simultaneously

Hensen+2015 (Delft), Giustina+2015 (Vienna), Shalm+2015 (NIST)

These are amazing experiments!

Still very far from definitive "loophole free" experiment

None of these tests were designed to fully address the "free will" loophole

Cosmic Bell tests will progressively attempt to do so

CAUSAL ALIGNMENT

Locality Loophole

Space-like separate these events:

measurement outcomes from each other
measurement outcome 1 from detector setting 2
(and vice versa)

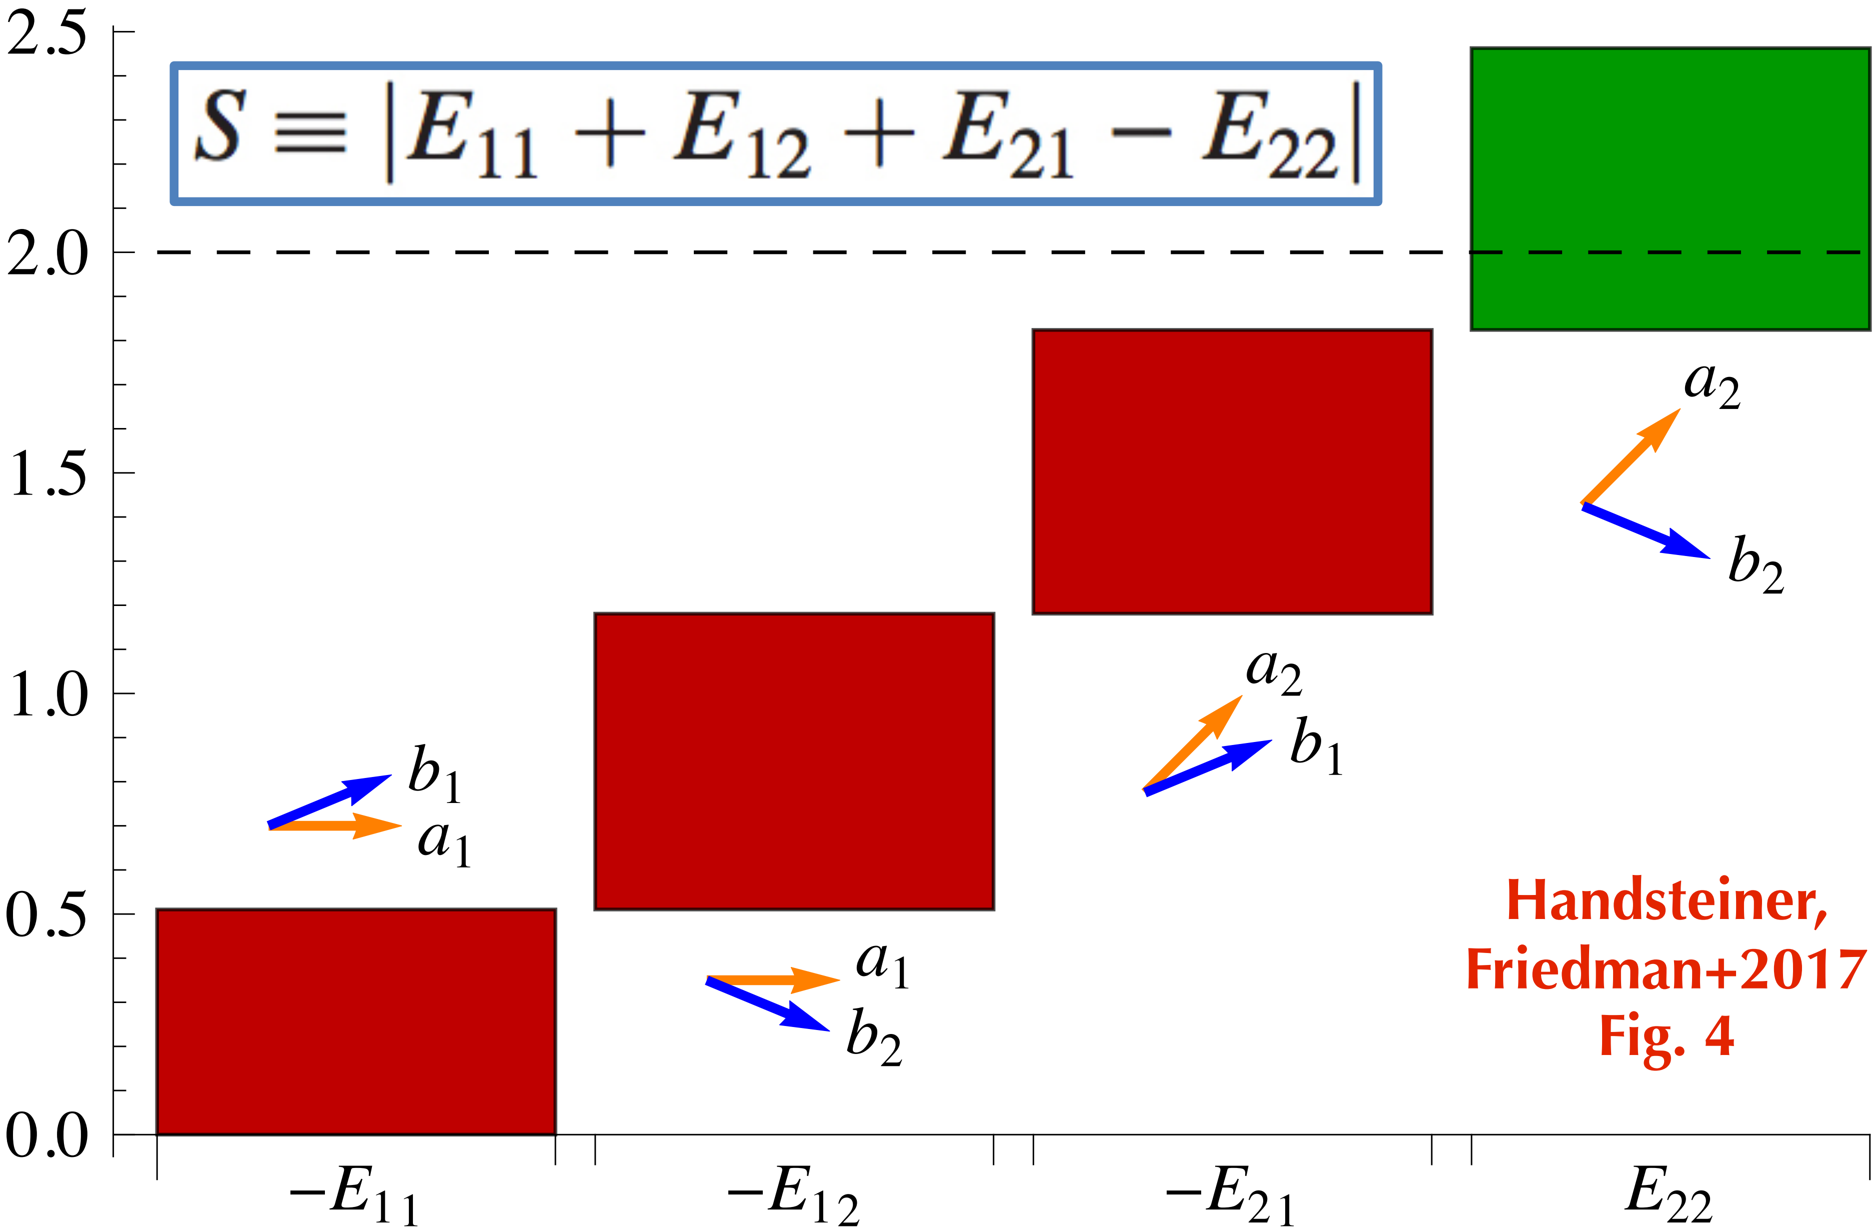
Locality Loophole+ Causal Alignment

Must space-like separate new pairs of events

Also need causal wavefront from star/quasar 1 to hit telescope 1 before telescope 2 or EPR source (and vice versa)

If final conditions are not met for either side at any time, can't use the data and also claim to have closed locality loophole.

OBSERVED BELL VIOLATION



DATA ANALYSIS

"Noise Loophole"

Need triggers by genuine cosmic photons, not local "noise" photons: atmospheric airglow, thermal dark counts, errant dichroic mirror reflections.

Conservatively allow S=4 for any background events, S<2 for cosmic photons. Accounts for bias in red/blue ports.

Observed sufficient signal-to-noise from cosmic sources.

Highly significant Bell violation still observed:

Run 1: 7.31 sigma, Run 2: 11.93 sigma

Cosmic test backs 'quantum spookiness'

Physicists harness starlight to support the case for entanglement.

QUANTUM PHYSICS SHOCKER: Scientists discover we have LESS free will than we thought

BY using quantum physics, scientists have been able to determine that we do not have as much free will as we are led to believe, according to the laws of the universe.

Testing Bell's Inequality with Cosmic Photons: Closing the Setting-Independence Loophole

Jason Gallicchio,[1,*] Andrew S. Friedman,[2,†] and David I. Kaiser[2,‡]
[1]*Kavli Institute for Cosmological Physics, University of Chicago, Chicago, Illinois 60637, USA*
[2]*Center for Theoretical Physics and Department of Physics, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139, USA*
(Received 25 October 2013; published 18 March 2014)

We propose a practical scheme to use photons from causally disconnected cosmic sources to set the detectors in an experimental test of Bell's inequality. In current experiments, with settings determined by quantum random number generators, only a small amount of correlation between detector settings and local hidden variables, established less than a millisecond before each experiment, would suffice to mimic the predictions of quantum mechanics. By setting the detectors using pairs of quasars or patches of the cosmic microwave background, observed violations of Bell's inequality would require any such coordination to have existed for billions of years—an improvement of 20 orders of magnitude.

The shared causal pasts and futures of cosmological events

Andrew S. Friedman,[1,*] David I. Kaiser,[1,†] and Jason Gallicchio[2,‡]

[1]*Center for Theoretical Physics and Department of Physics, Massachusetts Institute of Technology, Cambridge, Massachusetts 02139, USA*

[2]*Kavli Institute for Cosmological Physics, University of Chicago, Chicago, Illinois 60637, USA*

(Received 16 May 2013; published 21 August 2013)

We derive criteria for whether two cosmological events can have a shared causal past or a shared causal future, assuming a Friedmann-Lemaitre-Robertson-Walker (FLRW) universe with best-fit cosmological parameters from the *Planck* satellite. We further derive criteria for whether either cosmic event could have been in past causal contact with our own worldline since the time of the hot "big bang," which we take to be the end of early-universe inflation. We find that pairs of objects such as quasars on opposite sides of the sky with redshifts $z \geq 3.65$ have no shared causal past with each other or with our past worldline. More complicated constraints apply if the objects are at different redshifts from each other or appear at some relative angle less than 180°, as seen from Earth. We present examples of observed quasar pairs that satisfy all, some, or none of the criteria for past causal independence. Given dark energy and the recent accelerated expansion, our observable Universe has a finite conformal lifetime, and hence a cosmic event horizon at current redshift $z = 1.87$. We thus constrain whether pairs of cosmic events can signal each other's worldlines before the end of time. Lastly, we generalize the criteria for shared past and future causal domains for FLRW universes with nonzero spatial curvature.

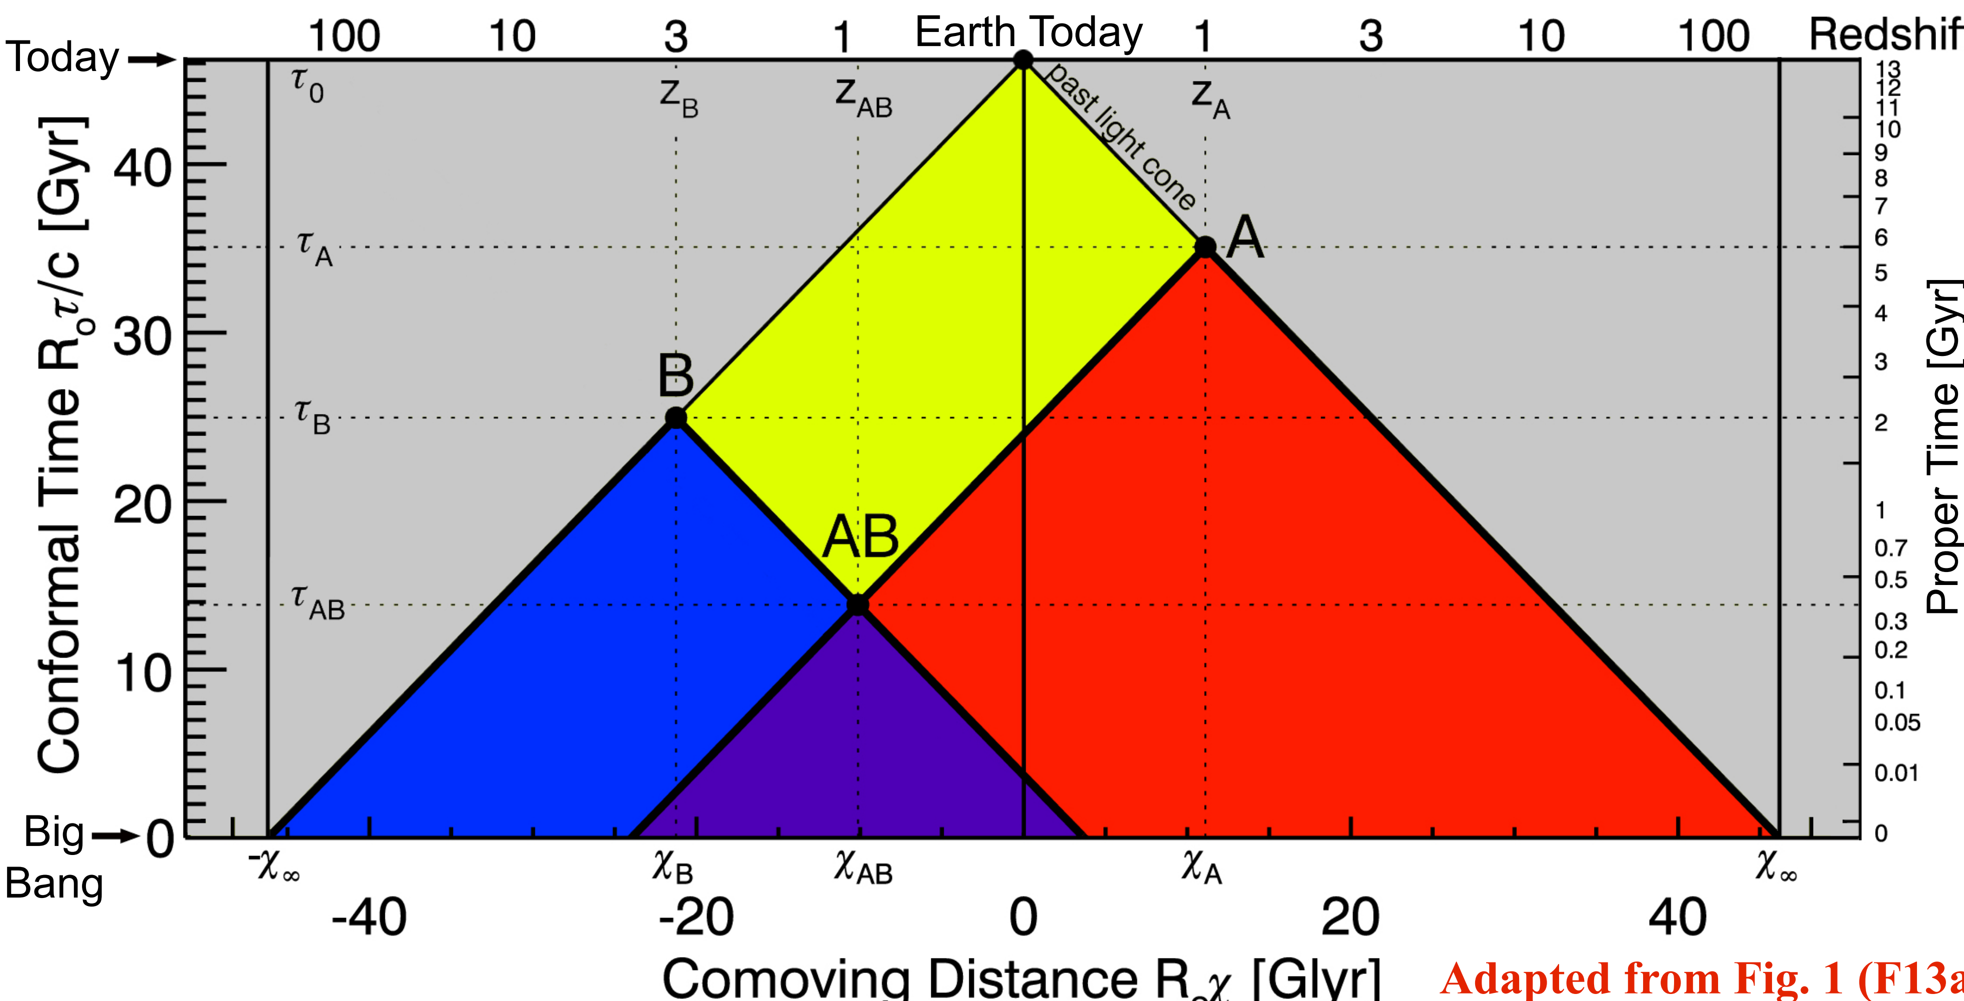
DOI: 10.1103/PhysRevD.88.044038 PACS numbers: 04.20.Gz, 98.80.−k

Why use quasars? Brightest continuous cosmological sources.

z > 3.65 quasars at 180 deg have no shared causal past since inflation

Friedman, Kaiser, & Gallicchio 2013a, *Phys. Rev. D,* Vol. 88, Iss. 4, id. 044038, 18 p. (arXiv:1305.3943)

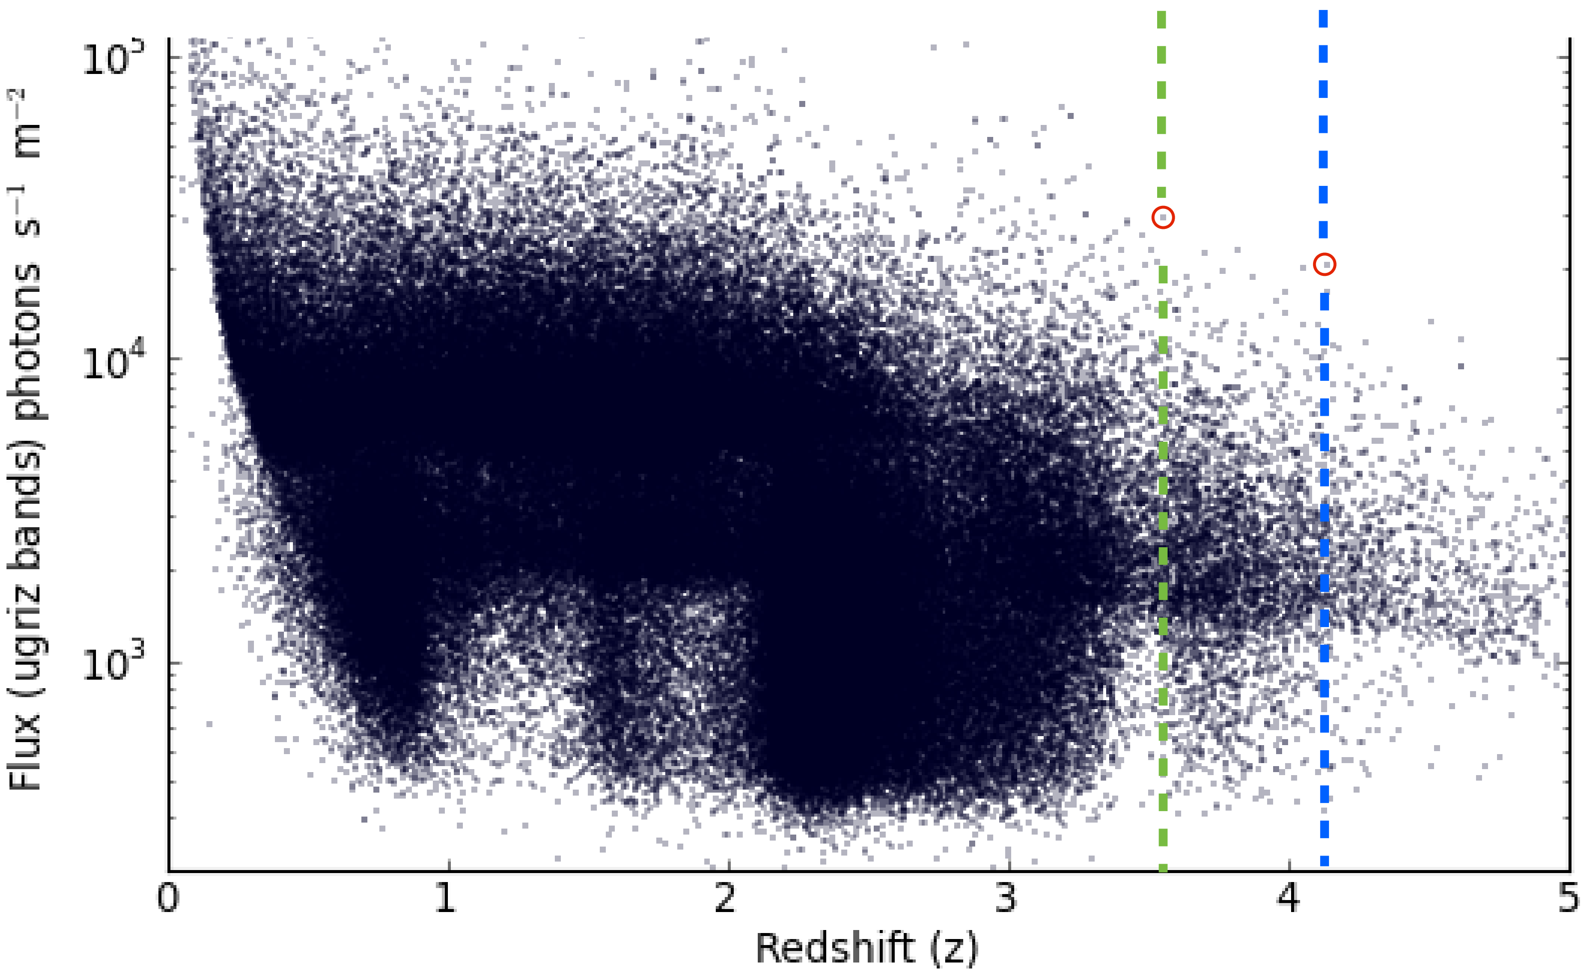
DO TWO COSMOLOGICAL EVENTS HAVE A SHARED PAST?



Adapted from Fig. 1 (F13a)

Since the hot big bang at the end of inflation

QUASAR FLUX VS. REDSHIFT



Ground based optical flux.

IR only usable from space

Local Sky noise!

Adapted from Fig. 3 (GFK13)

z~3.65 : $F_{Opt} \sim 3 \times 10^4$ photons s^{-1} m^{-2} **180 degrees**

z~4.13 : $F_{Opt} \sim 2 \times 10^4$ photons s^{-1} m^{-2} **130 degrees**

SDSS quasars - photometric and spectroscopic redshifts

2 OR MORE COSMIC SOURCES

2 (EPR) or 3 or more (GHZ) entangled particles

Greenberger, Horne, Zeilinger 1989; Greenberger+1990; Mermin 1990

Each cosmic source pair in set of N=2, 3 (or > 3) satisfies pairwise constraints from F13a

	Angular Separation	Redshift
2-Way Space	180°	$z > 3.65$
2-Way Ground	130°	$z > 4.13$
3-Way Space	120°	$z > 4.37$
3-Way Ground	105°	$z > 4.89$

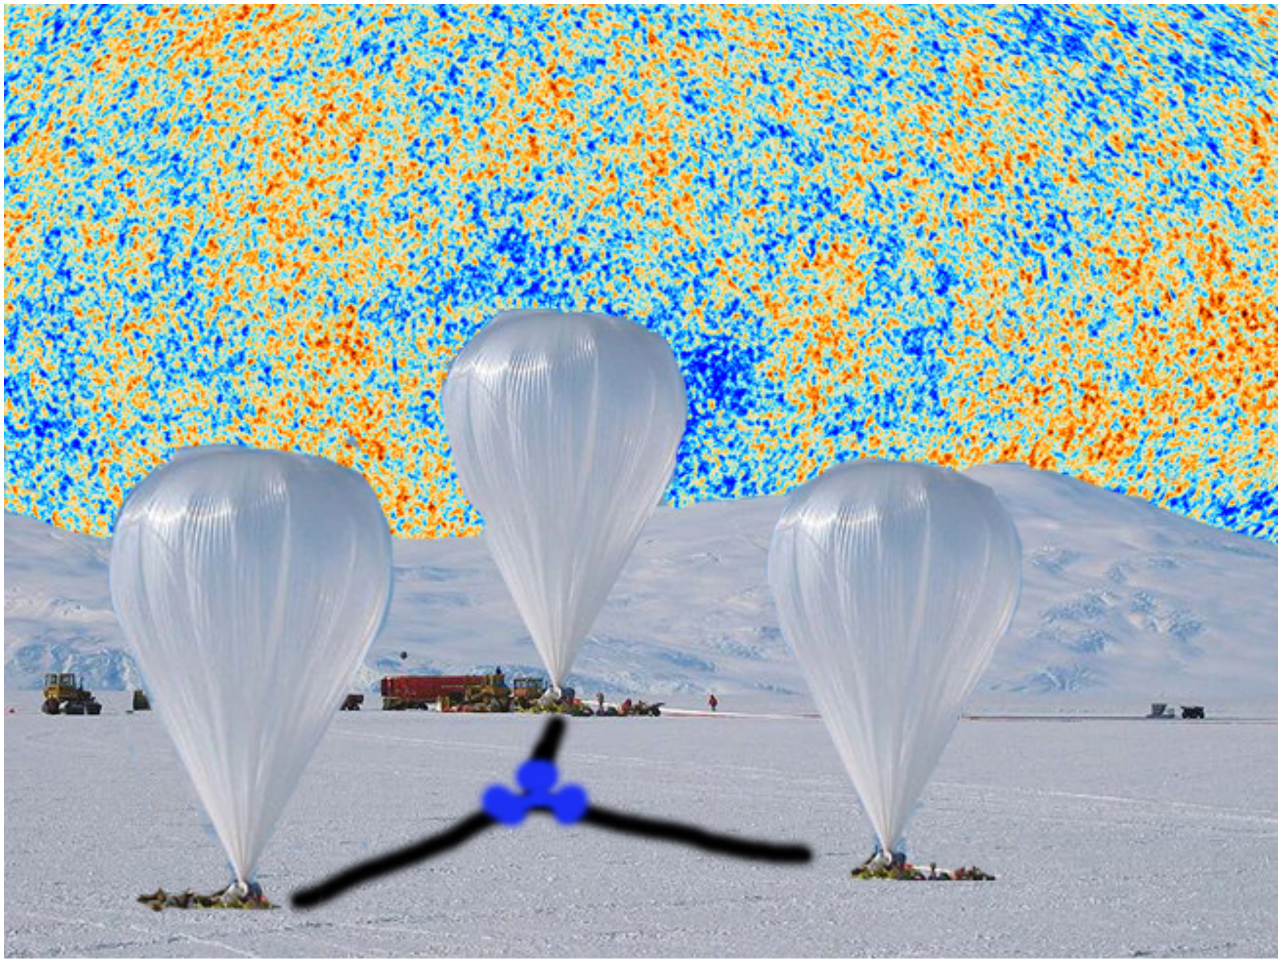
GFK13; Friedman+2017f *in prep*.

GHZ WITH CMB?

3+ particles, Bell's theorem without inequalities

QM, Local realism give opposite answers to yes/no questions

Greenberger, Horne, Zeilinger 1989; Greenberger+1990; Mermin 1990



Balloon based test in Antarctica?

Easy! Pick 3 CMB patches, each separated by 2.3°

Hard! Local noise dominates from ground (GFK14)

Noise loophole limits better than 2-particle Bell test (Hall 2011)

Observatory on La Palma

Possible Outcomes

Safe Bet

Bell inequalities always violated. Strengthen evidence for quantum theory.

Rule out alternative theories, close free will loophole as much as possible.

Longshot

Experimental results depends on which quasars we look at. Maybe Bell's limit is not violated for very distant quasars.

Perhaps experimenter's lack complete freedom!
