Do you believe in free will? Are people able to decide their own destinies, whether it's on what country they'll live, who or if they'll marry, or just where they'll get lunch today? Or are we just the unwitting pawns of some greater cosmic mechanism at work, ticking away the seconds and steering everyone and everything toward an inevitable, predetermined fate?

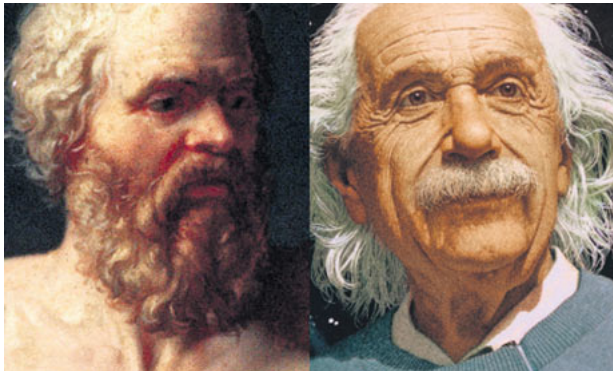

Philosophical debates aside, MIT researchers are actually looking to move past this age-old argument in their experiments once and for all, using some of the most distant and brilliant objects in the Universe.

Rather than ponder the ancient musings of Plato and Aristotle, researchers at MIT were trying to determine how to get past a more recent conundrum in physics: Bell's Theorem. Proposed by Irish physicist John Bell in 1964, the principle attempts to come to terms with the behavior of "entangled" quantum particles separated by great distances but somehow affected simultaneously and instantaneously by the measurement of one or the other — previously referred to by Einstein as "spooky action at a distance."

I'd like to have a minute of your time. I came across this story this morning and it fired my imagination. I hope you find it so as well. This seems to be a rather interesting topic and many here may find it worthwhile to read and contemplate. We are on the verge of some major realizations in my opinion. With all the latest scientific and technical developments over the past decades and a ever increasing access to higher observational abilities things are starting to get either bizarre or obtaining a higher understanding and clarity of who we are and how we perceive ourselves and the reality around us.

I'm not going to give the impression I know exactly how this will play out or if they are onto to something here. What is interesting is that they admit there are a Loop holes and that not all is known and open to change as new discovers/realizations are made.

The age old **Philosophy vs Science** seems to be at play here. Could one really determine if this dictates whether or not Free will exists?

Philosopher Julian Baggini fears that, as we learn more and more about the universe, scientists are becoming increasingly determined to stamp their mark on other disciplines. Here, he challenges theoretical physicist Lawrence Krauss over 'mission creep' among his peers

I've provided the second above link so those less familiar with the possible ramifications could gain a better understanding of the possible implications for us and how in the next couple of decades, or less, we may have some rather drastic changes in how we understand the world around us and why this with many of the other recent discoveries may be a major game changer either in our perceived reality or to many of our basic philosophical approaches and / or beliefs to life in general.

Back to the original article....

By using the light from objects that came into existence just shortly after the Big Bang to calibrate their detectors, the team hopes to remove any possibility of entanglement... and determine what's really in charge of the Universe.

"I think it's fair to say this is the final frontier, logically speaking, that stands between this enormously impressive accumulated experimental evidence and the interpretation of that evidence saying the world is governed by quantum mechanics,"

I'd like to hear what many of you have to say about this *pro, con, and other. Speculation, conjecture and theories especially are desired as well as those of a strict scientific and religious angles. This could turn out to

Here's one speculation which crossed my mind right away.

Somewhere, deep in our universe or beyond, there's an intelligent organism which mastered what we call "spooky action at a distance", so by 'reading' particles (but without influencing them) they exactly know where and what is happening across the universe, and has the ability to 'control' us or anything out there simply by choosing what they're observing.

One thing to remember regarding time travel is current laws of physics are in favor of loop holes and therefore time travel.

Thx Slayer, another mind bending, thought provoking thread.

"Ah! But what is really going to burn your noodle is: what made them decide to do this test in the first place?"

Not too sure if this is going to work. They are going to observe objects that were created "shortly" after the Big Bang.

"Shortly" = some time after the first 300,000 years of the Big Bang according to theory. So I'm not too sure that by observing these first and early quasars that it will remove any possibility of entanglement.

I do look forward to seeing what their results are.....or at least I decided to look forward to it.

Now I need some more coffee.....er.....yah.....I decided that on my own....right?
